

Windows Vista/7/8/10 RA4WVPN Setup

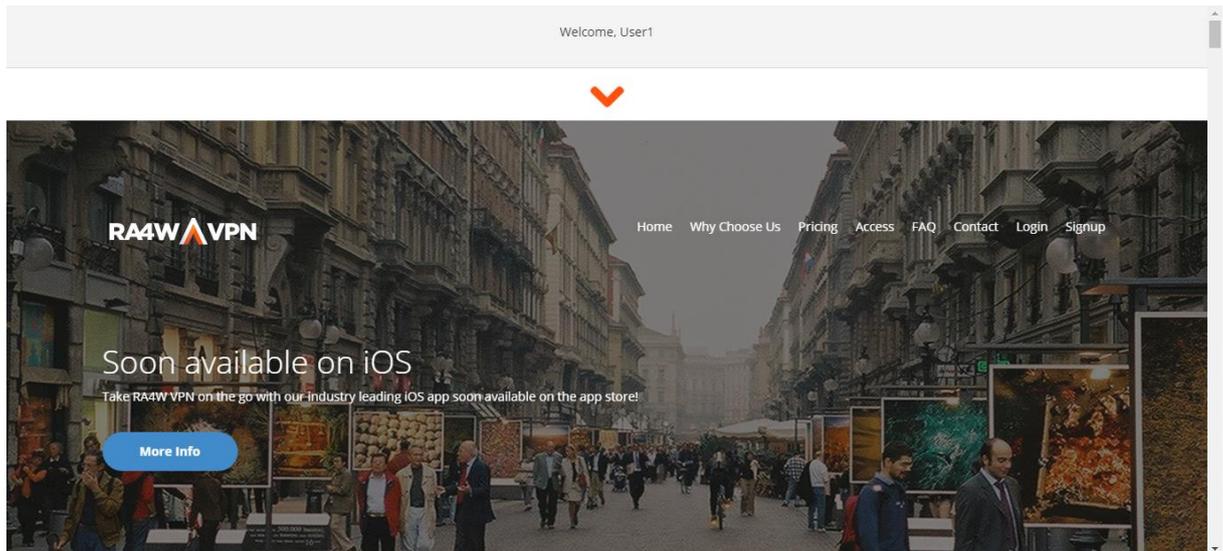

1. Go to <https://openvpn.net/index.php/download/community-downloads.html> and click on the latest version of the OpenVPN Software. This software is open source which means that it is available to download for free for personal use.

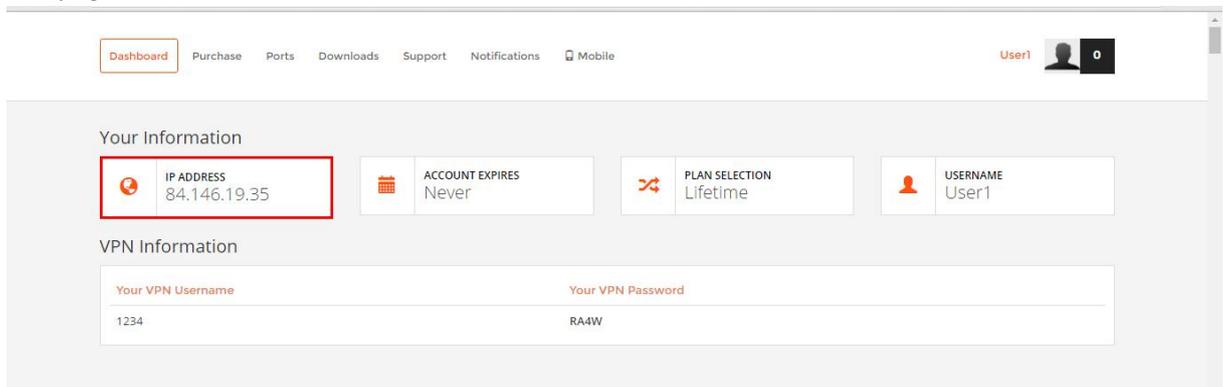

2. Once downloaded follow the installation wizard and read and then accept the terms and conditions and click install.
3. Once the software has finished installing, launch the program. As soon as the software is installed the program will appear in the quick access tray located at the bottom right hand corner of the desktop. You may have to click a small arrow pointing up to find the OpenVPN icon. This is how you will connect to your VPN from Windows.

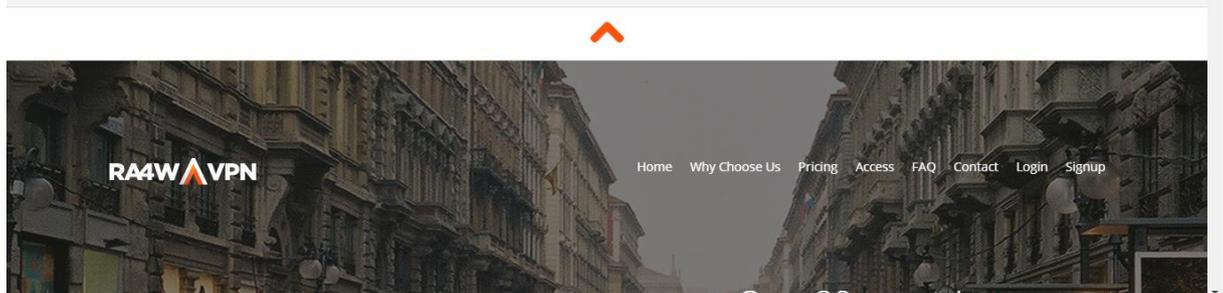

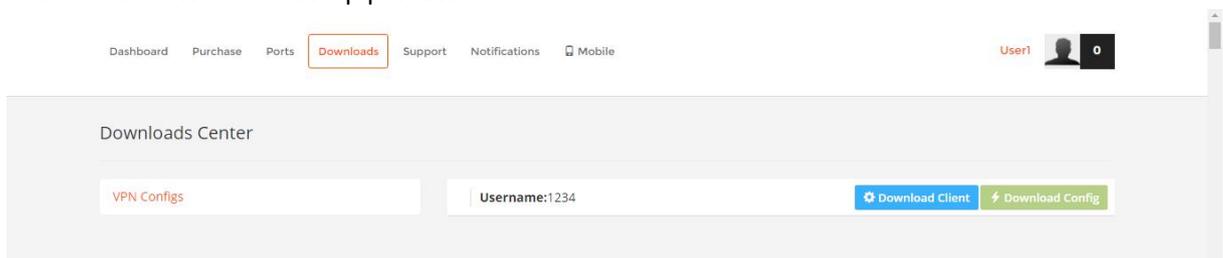

4. Now it's time to log into your RA4WVPN Account.

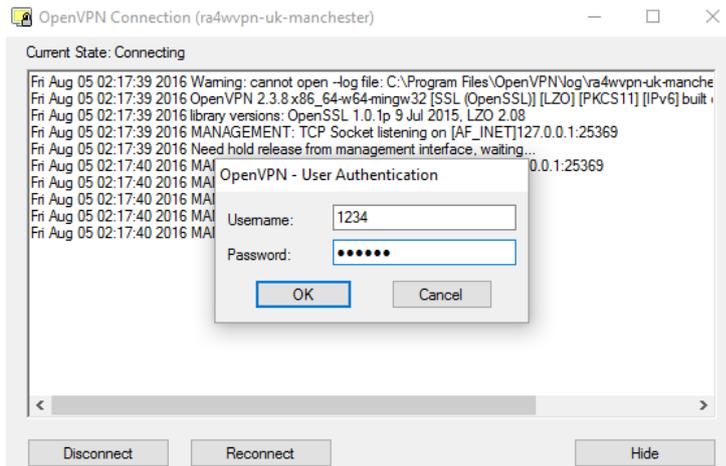

5. Once you have logged into your account click the little orange arrow located at the top of the webpage.

6. Here you will be presented with some information about your account. You will need this information later in the setup process.

7. Next navigate to the download center and click "Download Config". Save this to a location where it is easy for you to find.
8. Now you should import the server files into OpenVPN by simply 'dragging and dropping' into - C:\Program Files\OpenVPN\config. Please note that the TCP/UDP are best used in the appropriate situation, for example TCP are best used to bypass blocks in place at your workplace or school. And the UDP's are best used when your focus is on fast networking.
9. You are now able to access the VPN by choosing your favored server (By clicking on OpenVPN in the quick access tray). Make sure you log in when connecting (You will be prompted to log in) using your 4 digit VPN username and password.

10. Success! You are now connected to one of RA4W's premium servers, Enjoy!
